

You've just installed new tile in your new or current facility...

How soon will your new tile look old?

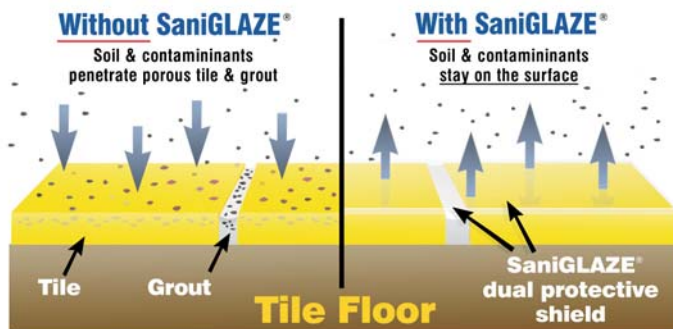

SaniGLAZE is the only process that can restore old, ugly, and unsanitary tile and grout to "like new". But did you know that SaniGLAZE can also **protect** new tile from becoming old and ugly looking?

You've made a serious investment in your new tile floors and walls. And while new tile is usually sealed when it is first installed, sealers are not permanent, and can quickly wear off. You'll soon notice that your new tile and fresh grout will start to absorb contaminants and dirty mop water, resulting once again in a dingy, unsanitary surface.

To safeguard your new surfaces from the inevitable, we recommend incorporating the SaniGLAZE process during installation. SaniGLAZE will prevent future grout discoloration, thus eliminating the need for harsh chemical cleaning. With the SaniGLAZE restorative bonding technology, your tile and grout surfaces can easily be maintained with environmentally friendly "Green" cleaning products.

Only The SaniGLAZE Process makes porous tile & grout maintainable!

6 great reasons why you'll love SaniGLAZE:

- Provides a moisture-proof protective shield
- Easy to keep "sparkling clean"
- Eliminates odors
- Stays "like new" for years
- Shields against mold and mildew
- Makes daily cleaning a "snap"
